

Tool Maintenance Or Be Good To Your Tools And They'll Be Good To You

**By Janean Thompson
Class of 2006**

All tools need care –

Three guidelines:

- Storage
- Cleanliness
- Sharpness

Simple Basics:

**Proper storage will
greatly lengthen
the life of your
TOOLS.**

**Racks are great for storage
but anything that gets them up
and away from the floor is best.**

**Drill hanging holes and use
nails, pegs to hang
tools.**

Care of tool handles:

Wash, then clean handles with a wet cloth. Dry.

Apply linseed oil or paste wax to condition.

**Rough, splintery handle
Sand handles with
sandpaper. Apply
linseed oil to
maintain smoothness.**

Clean blades and tines:

- **Remove all dirt at the end of each use.**
- **Hose them down
or
use a bucket of sand
to which vegetable
oil has been added**

- **Spray or wipe down with a light oil or spray like WD40**

(cooking oils work well and dissipate quickly. They do not cause problems with your soil.)

- **Rust should be removed**
By sanding
or wire brush

- **For severe coatings of rust**
Use wire brush
attachment on drill

Sharpening makes the tool work better and can be safer to use.

Different tools require different sharpening methods:

- Whetstone**
 - File**
 - Bench grinder**
 - Grinding attachment on drill**
- 

Whetstone:

- Use on hand clippers, cutters, and pruners

- **Secure cutters in a vise if available.**
 - **Working at a 45-degree angle, start at the outer edge and move toward the center**
 - **Move stone in one direction only, on one side of the blade.**
 - **When the edge is sharp, gently clean any burrs off the flat side of the blade.**
- 

Hoes and shovels are sharpened by using a mill file.

- Use the same 45 degree angle
- File in one direction, from one edge to the other.
- File (or sand) away any burrs from the backside of the blade.

For hedge clippers and shears:

- **Take the blades apart**
- **Follow the same directions as those given for shovels/hoes.**

(Work at 45 degrees from the outside to the inside of the blade.)

- **Sand or file away burrs from the backside.**

Mower blades:

Using the tool rest platform on a bench grinder, grind the edge of the mower blade.

- Bench grinders remove a lot of metal quickly... be cautious.
