

Unfortunately, there are too many examples of “crape murder” in East Texas which could be avoided by selection of the proper variety for the desired location. Since the mature size of the crape myrtle can vary from a miniature to a tree over twenty feet tall, one should select from the many available varieties to match the mature size for the plant location. If crape myrtles are pruned as severely as shown in the picture above, the new growth will be so weak that the heavy flower heads

will cause the limbs to droop unnaturally and even break.

The key to proper pruning of crape myrtles as shown in the picture below is never to trim anything larger than a wooden pencil. Crape myrtles do not have to be pruned at all, but if the first spent blooms are cut off the crape myrtle will bloom a second time in a season. Properly pruned crape myrtles can become wonderful accent plants in the landscape in all seasons of the year with colorful and graceful flowers, pretty fall color and shiny and defoliating bark of different colors.

CRAPE MYRTLES

“Lilac of the South”

A MOST VERSATILE & BEAUTIFUL
LANDSCAPE PLANT, BUT A MOST
ABUSED PLANT.
AVOID “CRAPE MURDER”
